User manual *short version* Avara alarm system

A complete version can be found on www.avara.no

The Avara alarm has 3 alarm modes;

1	**Always-on** The smoke, CO-gas and propane gas sensors are always active and cannot be turned off. **No operation required!**
2	**Night alarm mode** Turn the Night Alarm on if you want extra safety at night when you are sleeping in the motorhome/caravan. Alerts are given if break-in through *doors* and *hatches* equipped with *burglar detectors* are detected. Movement outside and along the walls sets off *flashing LED-lights* from the *external detectors*. If the movement on the outside does not stop after appr 30 sec, an alert signal is given **inside from the main unit**. You can move freely indoors without triggering the night alarm. Note that triggered alarms only give alerts in the *Main Unit*, not in the *siren*. (PS - Night alarm mode features does not apply to Avara Lite). **Night alarm is turned on by pressing at the lower part of the Main Unit lid. Confirmed by Green blinking LED every 10 sec.**
3	**Burglar alarm mode** Turns on if you leave the motorhome/caravan and want protection. An alerts is triggered by *burglar detectors* in doors and hatches, the *motion detector on the main unit* and the *G-sensor in the main unit* (detects if the entire vehicle is moved). There cannot be pets left inside the vehicle when the burglar alarm is on. Triggered alarm gives notification in the in-door *main unit*, the *siren* and sends notification to your mobile phone/e-mail (if online version). **You turn on your burglar alarm as follows:** 1. Hold the *key fob* close to bottom of the *Main Unit (small sign)* 2. While holding the key fob in place, press the lower part of the lid (any place on the lower part) *3. Hold the key fob still for about 3 sec. until you get a confirmation beep* - you can then remove the key fob and the alarm is on and *becomes active after 3 minutes*. **Confirmed by Red blinking LED every 10 sec and high-pitch "beep" while activating.**

"Hush" function

If you unintentionally trigger a smoke alarm during cooking, you can temporarily "hush" the alarm *while it is active by pressing the lower part of the main unit lid*. This will pause the alarm for 10 minutes after which it will automatically be active again.

Be aware if you see that the battery indicator *on the main unit lights up* red*. This is a common indicator for* all *devices and means that one detector either has weak batteries or that a detector is not communicating properly.*
See the complete version of the manual for solving this issue.

Remember to register your modem on www.avara.no to activate the functions you can access via mobile phone/Ipad/etc and PC. If your alarm package does not have a modem, this can be purchased separately.
